

System User Manual

Supplier and Order Management System

1. System Access & Credentials

The system is protected by strict Role-Based Access Control (RBAC). You must enter a valid Username to access your designated dashboard. **No password is required** in the current configuration—authentication is exclusively ID-based.

Default System Users:

Username (ID)	Role / Access Level
SUP123	Supplier Manager
ORD123	Order Manager

Note: If you have modified the system or run the Data Seeder, your specific IDs might differ. Use the credentials configured in your initial setup.

2. Getting Started (Login)

1. Launch the application using your IDE or by running the compiled `.jar` file.
2. You will be greeted by the **Login Screen**.
3. Enter your designated Username (e.g., `SUP123`) into the text field.
4. Click **Login**. The system will verify your role and automatically route you to the correct dashboard (Supplier or Order).
5. To switch users, click the **Logout** button located in the top-right corner of any dashboard.

3. Supplier Manager Workflow

If you log in as a Supplier Manager, you will be directed to the **Supplier Dashboard**. This is your centralized hub for managing supplier relationships, negotiating terms, and updating product catalogs.

Key Operations:

- **Add a New Supplier:** Click the green + *Add New Supplier* button. Fill in the Name, Business Number, Address, IBAN, and Payment Terms.
- **Select a Supplier:** Click on any supplier from the left-hand list. Their details will populate in the main workspace.
- **Overview & Settings Tab:** Update general entity information like the physical Address, Bank details (IBAN), or add/remove registered Manufacturers.
- **Contact Personnel Tab:** Maintain a directory of contacts. You can add new representatives, or edit existing names, phone numbers, and emails.
- **Agreements & Products Tab:**
 - First, **Add an Agreement** to define the fixed delivery days and specify whether the supplier provides transport.
 - Select the agreement to **Add Products** to the catalog (requires Catalog ID, Name, Base Price, and Stock Quantity).
 - Select a specific product to **Add Discounts** (e.g., 10% off for quantities of 100 or more).

4. Order Manager Workflow

If you log in as an Order Manager, you will see the **Order Dashboard**. This module is designed to help you quickly generate on-demand orders while automatically securing the best possible price.

Key Operations:

- **Start an Order:** Click the *Start Order* button to load the most up-to-date catalog from all active on-demand suppliers.
- **Search for Items:** Type the name of the desired product into the search bar. The system will filter available products dynamically. Click the product to proceed.
- **Calculate Cheapest Option:** Input the quantity required and click *Find Cheapest Supplier*. The system's algorithm will automatically scan all agreements, apply applicable bulk discounts, and select the most cost-effective supplier for that specific quantity.
- **Order Summary:** Once items are added, you are taken to a summary view. Here, you can modify quantities (the system will recalculate the best price), delete items, or return to the search screen to add more products.
- **Finalize Order:** Click *Make Order Final* to lock the transaction. The system will generate order receipts, deduct stock, and notify you of the required delivery methods.

5. Automatic Orders Setup (HQ Server)

To ensure the system automatically executes scheduled orders every day without manual intervention, configure a daily trigger using Windows Task Scheduler on the HQ computer.

Step-by-Step Configuration:

1. Press the Windows key, type **Task Scheduler**, and hit Enter.
2. On the right-hand panel, click **Create Basic Task...**
3. **Name:** Type *Super-Lee Auto Orders* and click Next.
4. **Trigger:** Select *Daily*, click Next, and set the time to whenever you want the orders generated (e.g., 08:00 AM). Click Next.
5. **Action:** Select *Start a program* and click Next.
6. **Program/script:** Type exactly `java`
7. **Add arguments:** Type exactly `-jar adss2025_v01.jar --auto` (ensure the jar name matches your final release build).
8. **Start in (CRITICAL STEP):** You **must** paste the absolute file path to the release folder where your JAR lives (e.g., `C:\Users\hensh\IdeaProjects\ADSS_Group_H\release\`). If you leave this blank, Windows will try to run the database relative to System32 and it will fail to find your .dat files!
9. Click **Finish**. The system will now automatically run the headless order execution process in the background every day.
