

a. Onboard new employee

USE CASE

Textual Description

The HR Manager enters the details of a new employee into the system, assigns them a specific role (e.g., Driver, Warehouseman), and saves their record to the unified database.

List of Actors

HR Manager

Pre-conditions

- The HR Manager is logged into the system.
- The requested role (e.g., Driver, Warehouseman, Storekeeper) is predefined in the system's role configurations.

Post-conditions

A new Employee record is created, associated with the selected role, and stored persistently in the database, allowing the employee to be scheduled for future shifts.

Main Success Scenario

1. The HR_Manager selects the option to add a new employee in the system interface.
2. The HR_Manager inputs the new employee's details (ID, name, bank account, salary, start date) and selects a Role.
3. The system validates that the provided employee ID does not already exist in the database.
4. The system validates the input data formatting (e.g., valid bank account, positive salary).
5. The system creates the new Employee record and associates it with the chosen Role.
6. The system persistently saves the record to the database.

7. The system displays a success confirmation message.

Alternatives / Extensions

3a. Employee ID already exists:

1. The system displays an error message indicating that the employee ID is already registered.
2. The use case terminates.

4a. Invalid input data:

1. The system highlights the invalid fields and displays a relevant error message (e.g., "Salary must be positive").
2. The HR_Manager corrects the data and submits again.
3. Return to step 3.
