

Use Case g: Scheduling Employees to Shifts

Use Case Specification	
Use Case Name	Scheduling employees to shifts
Textual Description	The HR Manager or relevant Branch Manager schedules qualified employees (including drivers, storekeepers, and other personnel) to weekly shifts based on branch operational requirements and individual worker availability constraints. These scheduled shifts are saved persistently to allow other modules (such as Transportation) to perform safety and presence validations.
Actors	HR Manager, Branch Manager
Pre-conditions	• The HR Manager or Branch Manager is successfully authenticated and logged into the system. • Employees have submitted their weekly shift availability and constraints. • Required operational roles (e.g., Driver, Storekeeper, Cashier) are predefined in the system configuration.
Post-conditions	The weekly shifts are successfully scheduled, updated, and persistently saved to the centralized database, establishing a valid baseline for delivery validation routines in the Transportation module.

Main Success Scenario

1. The HR_Manager or Branch_Manager selects the option to schedule a shift for a specific date, shift type (DAY/EVENING), and branch.
2. The system retrieves and displays a list of all active employees associated with that branch who are available and qualified for the required operational roles.
3. The HR_Manager or Branch_Manager assigns specific employees to the required shift roles (ensuring roles like 'Driver' and 'Storekeeper' are staffed according to expected demand).
4. The system automatically validates that each selected employee is qualified for their assigned role and does not have an active shift constraint or conflict.
5. The HR_Manager or Branch_Manager reviews the completed shift roster and submits the assignment.

6. The system persistently saves the shift records, updating the database state.
7. The system displays a clear success confirmation message to the user.

Alternatives / Extensions

4a. Employee qualification or availability conflict detected:

1. The system highlights the erroneous assignment, blocks the submission, and displays an explicit validation message (e.g., "Employee is already scheduled elsewhere" or "Employee lacks required role qualification").
2. The HR_Manager or Branch_Manager replaces the conflicting assignment with a different eligible employee.
3. The use case returns to step 4.
