

e. Process Periodic Orders

Textual Description	The system is triggered automatically on a daily basis to process purchase orders for suppliers whose fixed delivery day is scheduled for the following day, based on their active agreements.
List of Actors	HQ Automation (External Task Scheduler)
Pre-conditions	• Suppliers with active agreements exist in the system. • These suppliers have defined fixed delivery days and recurring product quantities.
Post-conditions	• New orders are created and persistently saved in the system for all suppliers scheduled to deliver goods tomorrow.

Main Success Scenario

1. The HQ Automation actor sends a request to the system to process periodic orders for the current date.
2. The system evaluates the stored supplier agreements.
3. The system identifies all suppliers whose fixed delivery day matches tomorrow's date.
4. The system retrieves the list of items and quantities from the agreements of these specific suppliers.
5. The system generates and saves new purchase orders for each of these suppliers in the database.
6. The system successfully completes the process and logs the execution.

Alternatives / Extensions

3a. No suppliers found with a delivery scheduled for tomorrow:

1. The system identifies that no suppliers require an order for the next day.
2. The system logs that no periodic orders are needed for this date.

3. The use case terminates.
