

assignDriverToShift

SYSTEM CONTRACT

Operation `assignDriverToShift(driverId: String, shiftId: String): boolean`

Cross References Use Case (Assign driver to shift)

Pre-conditions

- A valid `driverId` and `shiftId` are provided.

Post-conditions

- The system retrieved the target shift from the database via `ShiftDAO.getShift(shiftId)`.
- The system calculated the required license for the target shift via `TransportFacade.getRequiredLicenseForShift(targetShift)`.
- The system validated the employee's license against the requirements via `validateEmployeeLicense(driverId, requiredLicense)`.
- If the license is valid (`isValid == true`):
 - The driver *was added* to the shift with the role "Driver" via `targetShift.addEmployee(driverId, "Driver")`.
 - The updated shift details *were saved* persistently to the database via `ShiftDAO.updateShift(targetShift)` (*state modification*).
 - The operation returned `true`.
- If the license is invalid (`isValid == false`):
 - No state modification occurred.
 - The operation returned `false`.
