

Super-Lee Management System

Official User Instructions & Operations Guide • v2.0

Welcome to the Super-Lee Management System! This platform is designed to make running your supermarket chain as smooth and effortless as possible. From tracking inventory on the shelves to managing employee shifts and dispatching delivery trucks, everything you need is right here in one unified workspace.

1. Getting Started & System Data

We have designed the system to be completely standalone. You do not need to install any complex external databases to get started!

- **How to Launch:** Simply double-click the **ADSS_Group_H.jar** file, or run **java -jar ADSS_Group_H.jar** from your command line.
- **Pre-Loaded Data:** To help you explore the system immediately, the application comes with a pre-configured database. It is already populated with sample employees, drivers, products, categories, suppliers, and transport trucks.
- **Data Saving:** Everything you do is permanently saved to your local database (**Super-Lee.db**). You can safely close the app knowing your work is secure.

2. User Logins & Access Codes

Super-Lee uses a secure, role-based login system. Use the following passcodes at the Login Screen to access your desired dashboard:

Department Role	Passcode	What You Can Do
Human Resources Manager	HR123	Access the Workers Dashboard to manage employees and shifts.
Inventory Manager	INV123	Access the Inventory Dashboard to track stock and catalog items.
Supplier Manager	SUP123	Access the Suppliers Dashboard to manage supplier contracts.
Order Manager	ORD123	Access the Order Dashboard to oversee automatic and manual purchasing.
Transportation Manager	TRANS123	Access the Transport Dashboard to dispatch trucks and deliveries.

3. Department Dashboards Guide

Workers (Human Resources)

This module helps you keep track of your store's workforce and weekly scheduling.

- **Employees:** Hire new employees or update existing records. Adjust salaries, set job scopes, and manage banking details.
- **Shifts:** View the weekly schedule. Check which employees have requested to work, and assign them to Morning or Evening shifts.
- **Roles & Store:** Define exactly what your branch needs per shift (e.g., at least 2 Cashiers and 1 Shift Manager).

Inventory Management

Your complete overview of everything sitting on the shelves and in the back warehouse.

- **Products:** Add new items, update prices, and easily transfer stock from the warehouse to the storefront shelves.
- **Defects:** Report damaged or expired goods. The system will automatically update your total stock numbers for you.
- **Categories & Promotions:** Organize products into a category tree, and set up store-wide sales or percentage-based discounts.

✨ **Smart Feature:** If a product drops below its minimum threshold, the system automatically places a shortage order with the cheapest supplier!

Suppliers Management

Build and maintain relationships with your external vendors.

- **Suppliers:** Log new suppliers, update contact information, and assign their fixed delivery days.
- **Agreements & Pricing:** Define which items each supplier provides and set up quantity-based discount brackets.

Orders & The HQ Automation

Oversee all incoming shipments and purchasing logistics.

- **The HQ Server (Daily Automation):** The system uses a background script to automate your fixed-day deliveries. It checks the system to see if any suppliers have fixed delivery schedules for *tomorrow* and automatically generates the order *today*. (See Section 4 below for instructions on how to set this up).

- **Order Dashboard:** Review the history of automated orders placed by the HQ script. You can also bypass the automatic system and manually create an "Urgent Order" for next-day delivery.

Transportation & Logistics

Manage your fleet of trucks and ensure your store locations get their cargo safely.

- **Trucks & Drivers:** Register your fleet of trucks and their maximum weight limits. Register drivers and specify their license type (Standard or Heavy).
- **Deliveries & Cargo:** Plan delivery routes from the main warehouse to store branches and add specific cargo items to each destination.

✦ **Smart Feature:** Safety first! When you assign a driver and a truck to a delivery route, the system automatically verifies if the driver has the correct license for that specific truck's weight class.

4. Appendix: Automatic Orders Setup (HQ Server)

To ensure the system automatically executes scheduled periodic orders every day without manual intervention, you must configure a daily background trigger using Windows Task Scheduler on the main HQ computer.

⚠ **Note:** The Super-Lee application does not need to be open for this automation to work. However, the computer must be powered ON and awake at the scheduled time.

Step-by-Step Configuration:

1. Press the Windows key, type **Task Scheduler**, and hit Enter.
2. On the right-hand Actions panel, click **Create Basic Task...**

3. **Name:** Type *Super-Lee Auto Orders* and click Next.
4. **Trigger:** Select *Daily*, click Next, and set the time to whenever you want the orders generated (e.g., 08:00 AM). Click Next.
5. **Action:** Select *Start a program* and click Next.
6. **Program/script:** Type exactly **java**
7. **Add arguments:** Type exactly **-jar ADSS_Group_H.jar --auto**
(Ensure the .jar name matches your final release build).
8. **Start in (CRITICAL STEP):** You MUST paste the absolute folder path to where your JAR file lives (e.g.,
C:\Users\hensh\IdeaProjects\ADSS_Group_H\release). If you leave this blank, Windows will try to run the application relative to System32 and it will fail to find your database files!
9. Click **Finish**. The system will now automatically run the headless order execution process in the background every day.
