

addEmployee

SYSTEM CONTRACT

Operation `addEmployee(employee: EmployeeSL): String`

Cross References Use Case (Add new employee)

Pre-conditions

- An `EmployeeSL` data transfer object containing the initialization details is provided.

Post-conditions

- The system generated a random secure password string via `PasswordGenerator.generatePassword()`.
- The system verified if an employee matching the provided `id` already exists in the database via `EmployeeDAO.exists(id)`.
- If the employee does not exist (`exists == false`):
 - The `EmployeeSL` instance *was converted* to an **Employee** entity using the generated password.
 - The new Employee entity *was saved* persistently to the database via `EmployeeDAO.addUpdateEmployee(entity)` (*state modification*).
 - The operation returned the newly generated password string.
- If the employee already exists (`exists == true`):
 - An `IllegalArgumentException` *was thrown*.
 - No state modification occurred.
